 - Tight sites
- Hydro's Product line
- Survey

A photograph of a large industrial facility, likely a hydroelectric power plant. In the foreground, a large white pipe is angled downwards, with a significant amount of white water splashing out from its end. Below the pipe, there are several rectangular basins or channels. The floor of these basins is covered with bright yellow, grid-like safety grates. In the background, the facility's interior is visible, featuring a high ceiling with a complex network of steel beams and various pipes. A person in a white protective suit is visible in the distance, working on the equipment. The overall scene conveys a sense of large-scale industrial engineering and energy production.

Why Hydro?

Our Expertise

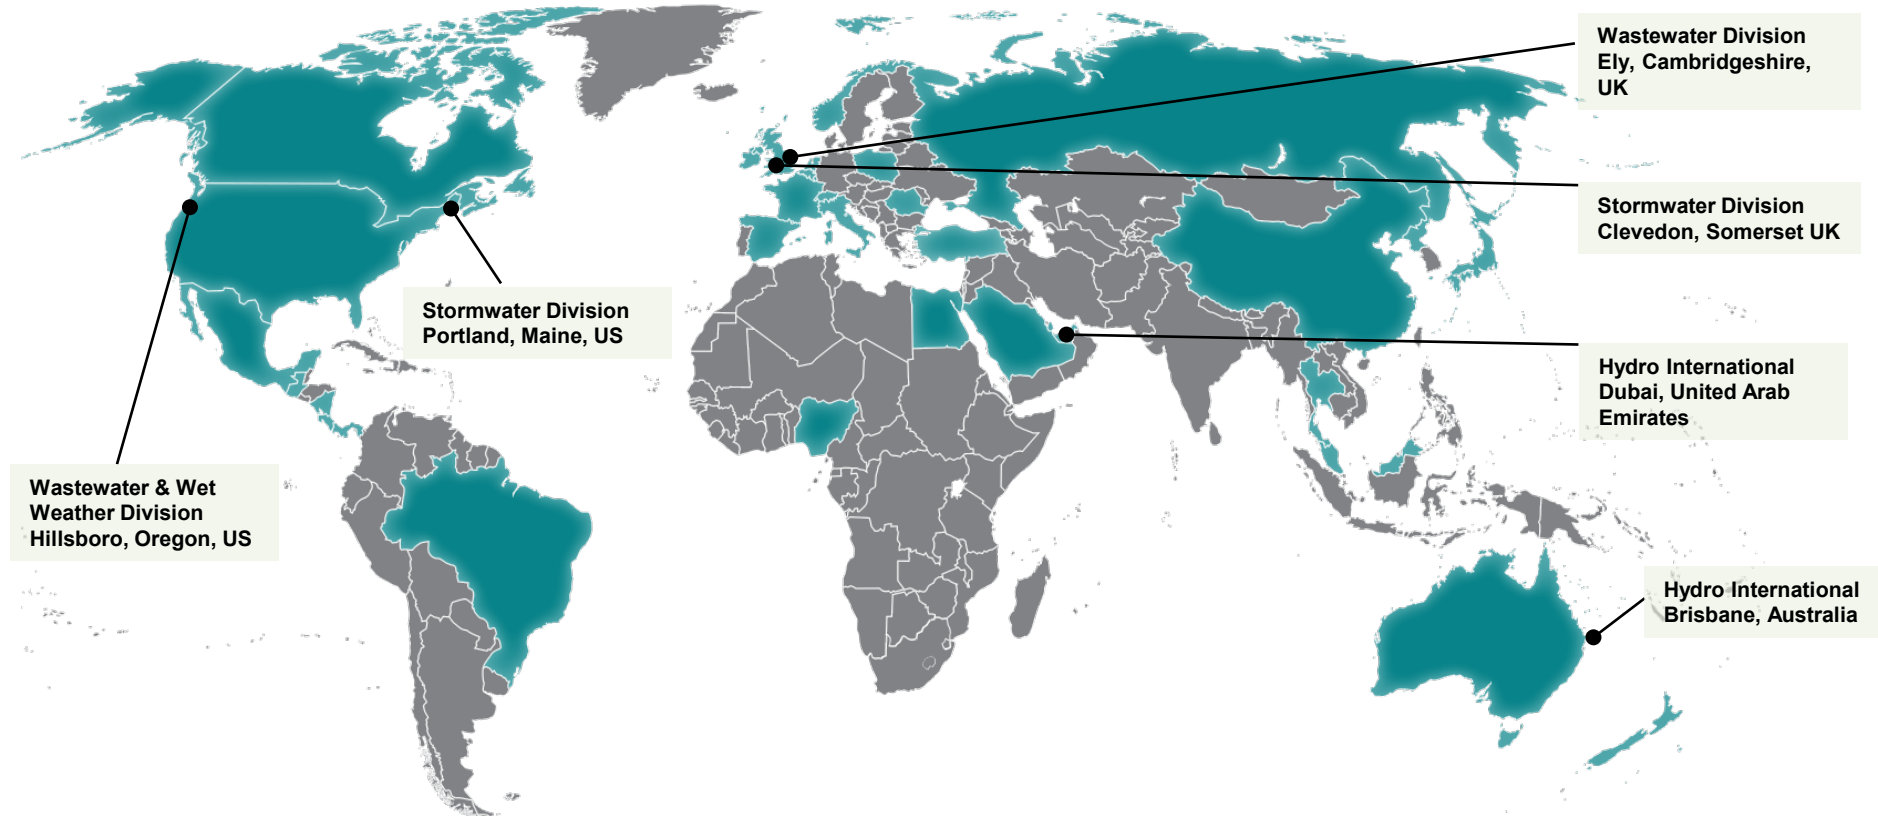

- We're a water treatment company first
- We've developed our own technologies
- We continually improve and perfect our products in our world-class hydraulics laboratory

We're Local *and* Global

33 Countries

350+ Employees

Florida Stormwater Challenges

Why Remove Pollutants from Stormwater?

Failure to remove pollutants can result in impaired waterways which, can affect aquatic ecosystems, health issues and create an eyesore.

northern Indian river lagoon

The Trouble with Trash

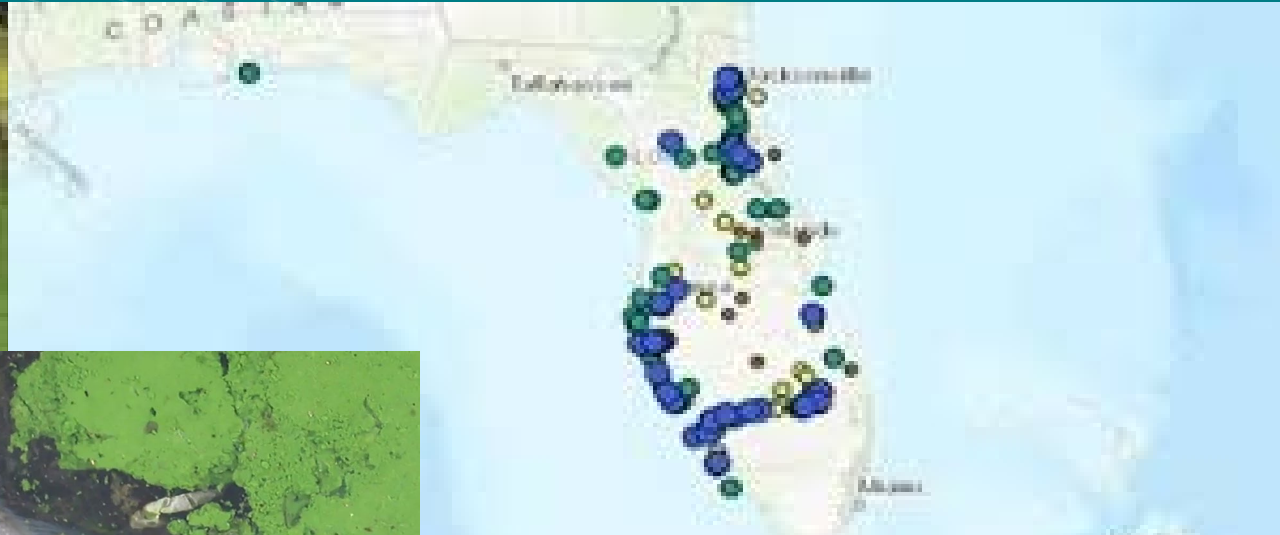

- Degrades natural habitats
- Economic Harm
 - *It's an eyesore that hurts tourism*
 - *Shoreline communities spend millions in cleanup costs*
- Poses public health threats

Aquatic Wildlife

Nutrient Pollution

Hydrocarbons Pollutants

What's at Stake for Our Economy in Florida

Sunshine isn't enough!

- **\$2 trillion** annually are potentially at risk.
- On a smaller scale, tourism in Lee and Collier counties alone has yearly economic impact approaching **\$4.5 billion**

2nd Generation Baffle Box

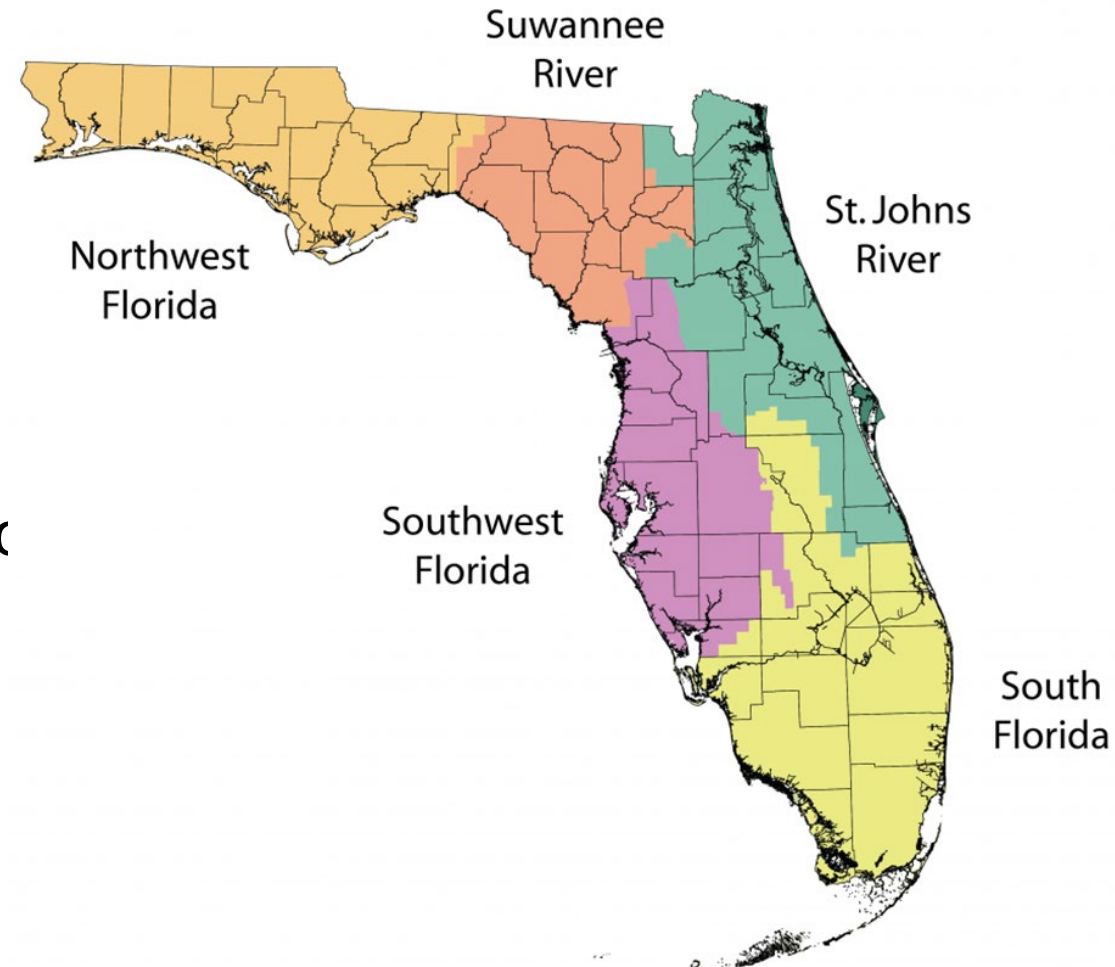

Advanced Vortex Separators

Filtration System

2nd Generation Filtration System

Bioretention

- FDEP – NPDES
 - SMALL-Disturb one of less five acres
 - LARGE – Disturbs five or greater
- 5 Water Management Districts
 - Impaired waters
 - Capture water quality volume (1,2,3+ inc
 - Reduce your load TP, TN
 - 80% TSS, Trash, Hydrocarbons
- Counties
 - What is accepted?
 - Do you get credit ?

Site Conditions to Overcome

- Tailwater and Tidal Conditions
- High ground water | High water table
- High flows
- Tight sites

Product Solutions

Downstream Defender® Hydrodynamic Separator

Downstream Defender

Components

- | | |
|------------------------------------|--------------------------|
| 1. Inlet to Precast Vortex Chamber | 4. Outlet Pipe |
| 2. Cylindrical Baffle | 5. Sediment Storage Sump |
| 3. Center Shaft | 6. Access Lid |

Separators are Designed for

- Coarse particles and sediment
- Sediment-bound metals
- Trash & floatables
- High Flow
- Hydrocarbons

Coarse particles

High flow

Oils & hydrocarbons

Trash & floatables

Acceptance FDEP on Material to TP and TN

*“Methodology for Calculating
Nutrient Load Reductions Using
the FSA Assessment Tool”
(Bateman, 2012)*

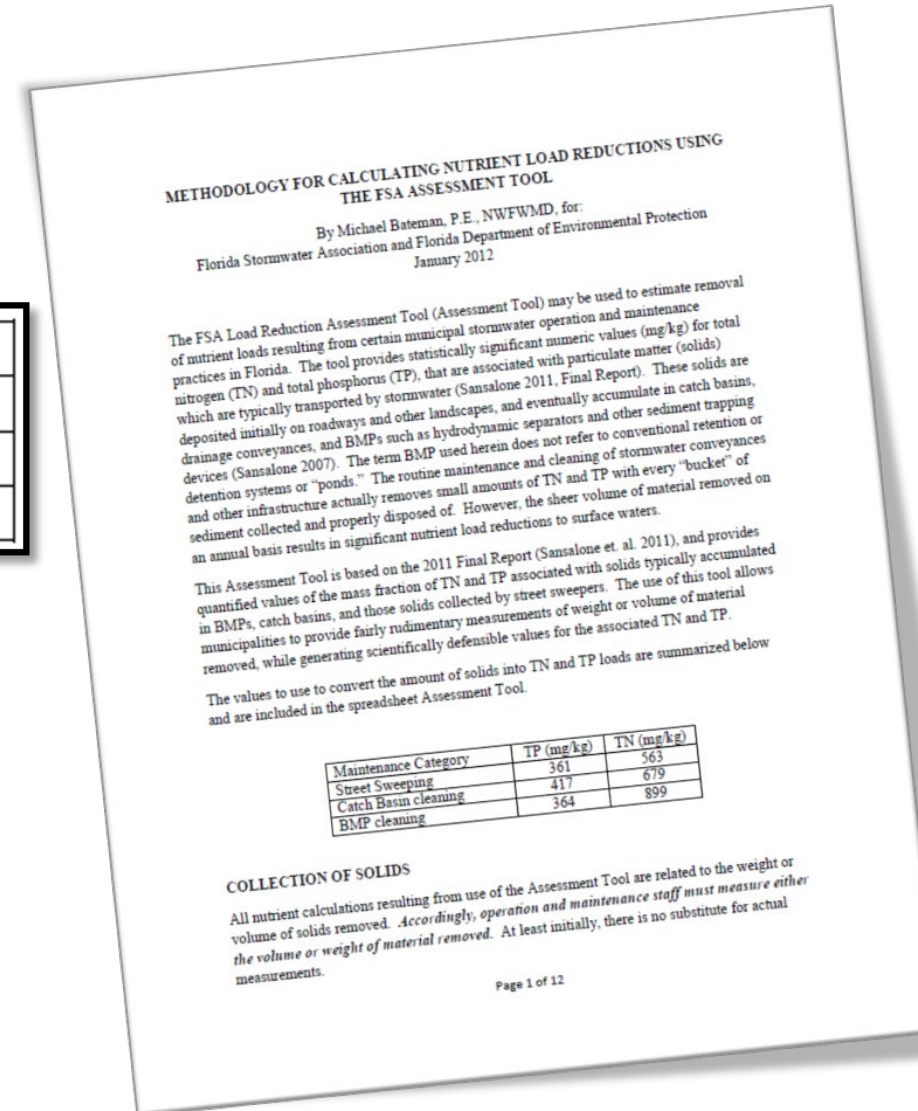

Maintenance Category	TP (mg/kg)	TN (mg/kg)
Street Sweeping	361	563
Catch Basin cleaning	417	679
BMP cleaning	364	899

TSS = 4013 lbs/acre-foot

TP = 1.67 lbs/acre-foot

TN = 2.73 lbs/acre-foot

Accepted by FDEP, 100% trash capture by CA Waterboard and
can be molded in BMPTrains

Defender®

Simple maintenance.

Stormwater Solutions
Turning Water Around...®

Reasons to Specify First Defense® Hydrodynamic Separator

Product Profile – First Defense

- Flexible inlet angles
- Multiple pipes
- Inverts do not need to match
- Can handle high flows through a small footprint
- Works with large pipes
- Grate Inlet

Downstream Defender vs. First Defense

Downstream Defender®

DEPENDABLE POLLUTANT CAPTURE

- Trash capture
- Oil capture
- Tail water & Tidal conditions
- Large drainage areas

First Defense®

SIMPLE DESIGN & SITE FLEXIBILITY

- Easy design/site flexibility
- High peak flow
- Surface inlet/grate
- Multiple inlet

Up-Flo® Filter

System Components

- | | |
|---|---|
| 1. Inlet grate (pictured) or Inlet Pipe (not shown) | 5. Bypass Hood/Siphon |
| 2. Precast Filtration Chamber | 6. Outlet Module with Drain Down Filter |
| 3. Filter Module | 7. Pollutant Storage Sump |
| 4. 4mm Screening | 8. Media bags |

Filter Components

Designed for Florida

- Accepted by FDEP
- 92% TSS Removal
- TN = 70% (BMP Trains)
- TP = 50% (BMP Trains)
- Design flow in FL 9 GPM

Industrial materials

Metals

Nutrients

Very fine particles

- Full-Scale 4-ft Manhole with 6 Filter Modules

Depending on the storm event intensity and wind direction the drainage area can vary from 5,400 to 8,600 ft² (0.12 to 0.20 acres) of pavement. The catchment drains to inlet A as shown in **Figure 4(b) and 4(a)**. Runoff captured by inlet A is the source of influent to the downstream Up-Flo[®] filter.

PHYSICAL MODEL TESTING AND MONITORING OF A
HYDRO INTERNATIONAL (HI) UP-FLO FILTER SUBJECT TO
RAINFALL-RUNOFF LOADING EVENTS

Monitoring Report for Hydro International Up-Flo Filter Prepared By:

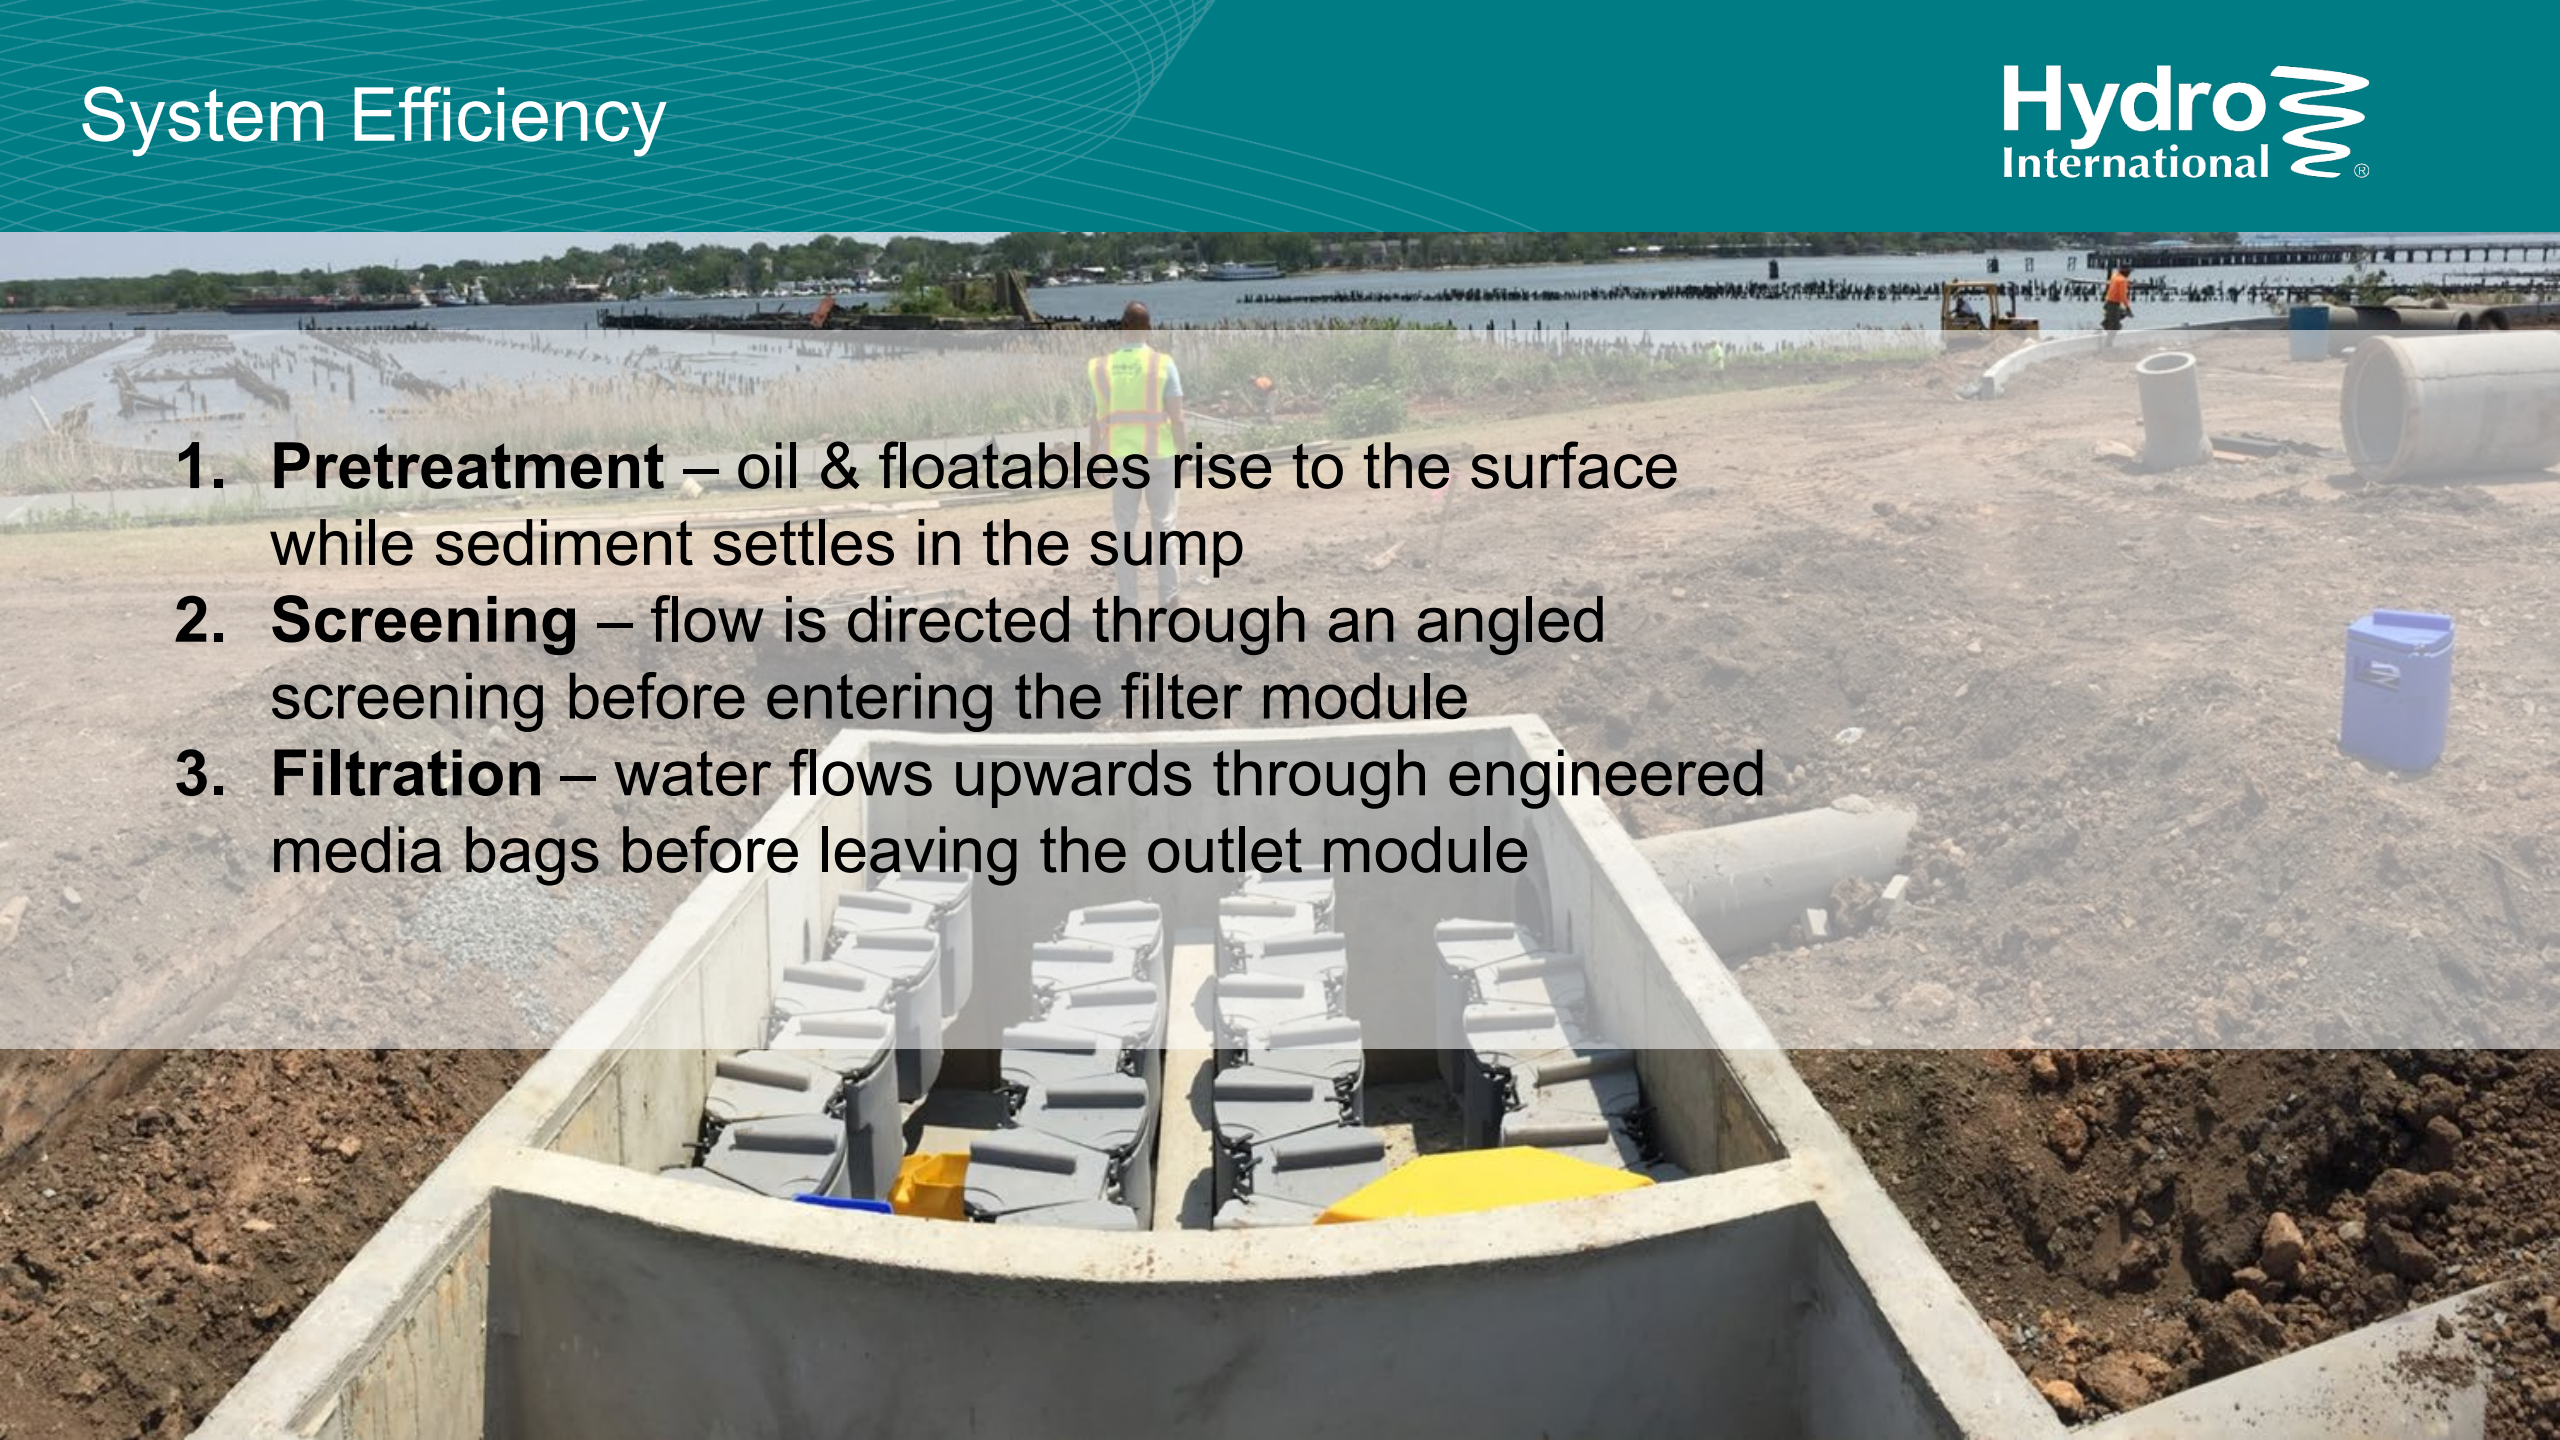

University of Florida
Engineering School of Sustainable Infrastructure and Environment (ESSIE)
University of Florida
Gainesville, FL 32611 USA

Draft Version: 05 April 2017

Pollutant's Captured

- Trash
- TSS – sediment
- Oil & Hydrocarbons
- TP & TN

- 
1. **Pretreatment** – oil & floatables rise to the surface while sediment settles in the sump
 2. **Screening** – flow is directed through an angled screening before entering the filter module
 3. **Filtration** – water flows upwards through engineered media bags before leaving the outlet module

Easy Maintenance, Less Often

- Straightforward sump access, light-weight media packs are easily replaced without removing the entire filter module
- Longer media life means you can go longer between servicings.

Hydro DryScreen® Next Generation Baffle Box & Up-Flo® Filter

Hydro DryScreen® with and without Up-Flo® Filter

Components

- | | |
|---------------------------------|---------------------------|
| 1. Inlet Pipe | 5. Vertical Screened Weir |
| 2. Access Lids | 6. Flow Spreader |
| 3. Precast Vault | 7. Sediment Storage Sump |
| 4. Adjustable Height Dry Screen | 8. Outlet Pipe |

Components

- | | |
|---------------------------------|--------------------------|
| 1. Inlet Pipe | 7. Flow Spreader |
| 2. Access Lids | 8. Sediment Storage Sump |
| 3. Precast Vault | 9. Weir Wall |
| 4. Adjustable Height Dry Screen | 10. Outlet Pipe |
| 5. Up-Flo Filter Bypass Hood | |
| 6. Up-Flo Filter module | |

Hydro DryScreen® Next Generation Baffle Box

1. Large pipes and large peak flows
2. Shallow sites or areas with a high water table
3. Trash and floatable removal
4. Nutrient removal
5. Sediment removal

Hydro DryScreen® Next Generation Baffle Box with Up-Flo® Filter

1. Large pipes and large peak flows
2. Shallow sites or areas with a high-water table
3. Trash and floatable removal
4. Nutrient removal
5. Sediment removal
6. Particulate & dissolved metals
7. Nutrients
8. Very fine particles

Accepted by California Water Boards for 100% Trash Capture

- Both Hydro DryScreen[®] & Up-Flo Filter are Accepted by California Water Boards for 100% Trash Capture
- Four years of trash study data demonstrates that Hydro DryScreen removes 97% of trash collected

Type 2 or Nutrient Separating Baffle Box

*Type 2 baffle boxes averaged

- 67.2% TSS removal
- 19% TN removal
- 15.5% TP removal.

Now accepted for use by the **Florida Department of Environmental Protection** for the following removal efficiencies:

- **92% Sediment Removal**
- **70% Nitrogen Removal**
- **50% Phosphorous Removal**

Statewide Best Management Practice (BMP) Efficiencies for Nonpoint Source Management of Surface Waters Draft – July 2018

This document describes the DEP methods to calculate total nitrogen (TN) and total phosphorus (TP) reductions for urban stormwater loads related to surface watershed restoration, when site-specific information is not available. These calculation methods represent typical BMP performance, which may be useful to stakeholders when selecting BMPs to achieve surface water nutrient load reductions related to the development and implementation of basin management action plans (BMAPs), 4e plans, and 4b/reasonable assurance plans (RAPs). DEP assigns nutrient removal efficiencies and nutrient credits to BMPs on a case-by-case basis, using the information in this document as a guide during the decision-making process. This working document will be updated periodically as new information becomes available. To download the latest version, visit: <http://publicfiles.dep.state.fl.us/DEAR/BMAP/Resources/>.

These calculation methods are not designed for use with Environmental Resource Permits (ERPs). The appropriate permitting agency should be consulted for its approved calculation methods.

Table 1 lists the removal efficiencies for various standard BMP types. **Table 2** lists the TN and TP reductions for provisional nonpoint source management BMPs. **Table 3** lists the BMPs for which data are lacking and water quality benefits are unknown. As additional data become available, these BMPs may be assigned provisional load reduction credits.

It should be noted that for certain BMPs, reductions resulting from regular required maintenance are implicit in the initial credit given during installation or implementation. Therefore, operations and maintenance (O&M) required for the BMP will not qualify for additional credits. However, if a project did not receive credits for the initial installation or implementation of the BMP, regular maintenance may qualify for credit. Decisions will be made on a case-by-case basis.

Specific activities ineligible for nutrient credits include macroalgal harvesting and natural wetlands as filters, as listed in **Table 4**. Macroalgal harvesting from an impaired waterbody is not eligible for credits, because it is a biological result of nutrient loading that should be abated before it reaches the waterbody of concern. See **Table 2** for information about aquatic vegetation harvesting that is eligible for credit, based on specific conditions. Filtration from natural wetlands is ineligible for credit, because this is considered part of the existing conditions when required load reductions are determined. Various types of artificial wetlands and modular wetland treatment systems are eligible for nutrient credits.

Equations for online and offline retention BMPs are listed in **Table 5** and are based on the volume resulting from multiplying the corresponding inches of retention and the sub-basin area. In addition, this document includes the wet detention removal efficiency curves for TP (**Figure 1**) and TN (**Figure 2**).

Screens must be *Dry*

Screens need to be kept up and out of the wet sump so that water doesn't erode organic material and cause nutrient pollution.

Even Flow Distribution

Splitting the flow means more screen surface area is used so you can go longer without blinding

Hydro DryScreen®

Other Screening Baffle Boxes

Performs when Screen is 80% Blinded

If you don't split the flow, you'll pulverize the leaves, paper, cigarette butts and other pollutants allowing them to fall into the sump

Testing shows that the DryScreen performs as intended even when the screen is blinded up to 80%

NOTE FOR TREATMENT EFFICIENCY GRAPH:

The purpose of this graph is to help illustrate the treatment efficiency of the system as the function of retention depth. The graph illustrates that there is a point of diminished return as the retention depth is substantially increased. Therefore, to provide the most economical BMP treatment system, either alternative such as "treatment trains" and compensatory treatment should be considered.

Fogarty Training Center

FSA's Training Center was created in 2005 in response to the need for up-to-date, high quality training for stormwater professionals. All classes are taught by [qualified expert trainers](#) and include all materials. That's not all, FSA's Stormwater Operator Certification Training is [recognized by FDEP](#) and helps fulfill the training requirements of your MS4 permit! View the [Stormwater Operator Certification Renewal Date List](#) for recertification deadlines. The Center was named FSA's Fogarty Training Center in 2016 in recognition of the work of [Keith Fogarty](#), Past President of FSA and long-time trainer, who was the driving force in creating the Association's training program.
